

be the case for the predicted interaction between VpsT and VpsR. Thus, further development of computational approaches for ordering genes into pathways using high-dimensional phenotypes, which can incorporate more general models of epistasis than presented here, may hold promise for application to a wide variety of genotype-phenotype investigations to accelerate our understanding of various disease-related processes.

## 5. Acknowledgments

JMS was supported by NSF grant DBI-0543197 and a fellowship from the Alfred P. Sloan foundation. CHY was supported by the Leon Levy Foundation and the Simons Foundation at the IAS, Princeton, NJ.
